Wi-Fi 7 9300Mbps Tri-Band Ceiling Mount Access Point

WI-AP229BE

Overview

WI-AP229BE is a high-performance indoor Wi-Fi7 tri-band ceiling-mounted access point. Complying with 802.11be Wi-Fi 7 standards, it provides concurrent tri-band with access rate up to 9.3Gbps. Supporting Multi-link Operation(MLO), Multi-RUs, MU-MIMO, OFDMA, 4K-QAM and 320MHz, WI-AP229BE can ensure multiple clients access to the Internet at the same time and enables improved data transmission efficiency with reduced latency, which makes it capable of providing remarkable performance in high-density environments such as hotel, office, stadiums and etc,. Besides, it supports 802.3bt PoE input, which makes it easy to make the device deployment. In addition, it supports cloud management, and users can quickly configure, remotely manage and operate network-wide equipment, greatly reducing equipment investment costs.

Features

Unleashed Tri-band Wi-Fi Speed up to 9300Mbps

Supporting the 4K-QAM and 6GHz band up to 320MHz, WI-AP229BE provides unprecedented Wi-Fi speed up to 9300Mbps, which enables faster, smoother network experience and reduced latency.

MLO and Multi-RUs for Boosted Network Performance

With Multi-Link Operation (MLO), WI-AP229BE allows network devices to communicate across multiple bands and channels simultaneously. Introducing Multi Resource Units (Multi-RUs) and puncturing, it enables increased data rate and significantly reduced latency by Utilizing more idle frequency bands.

Lightning-fast Wired Performance with 10G SFP+ Port

With one 10G SFP Port, provides amazing multi-gigabit performance for higher bandwidth and supports transmission distance up to 20km. Besides, WI-AP229BE provides one 2.5G RJ45 LAN port for blazing-fast wired connections.

2.5G 802.3bt PoE-IN Port for Flexible Deployment

Adopting 802.bt PoE Input can enable Ethernet port to carry data and power simultaneously via one cable, making deployment easy and flexible.

Automatic Channel and Power Adjustment

Through channel adjustment, the optimal channel is allocated to each AP to minimize or avoid the interference of adjacent channels and the same channel, which ensures the reliable data transmission in the network.
